

JOSE ANTONIO CAMPOS

Riverview, FL 33578 | (727) 517-6644 | jjosecampos@gmail.com | linkedin.com/in/jose-a-campos | camposja.github.io

SENIOR FULL STACK RUBY ON RAILS ENGINEER

Senior Full Stack Engineer with 8+ years of hands-on Ruby on Rails experience building, scaling, and maintaining high-availability web applications across insurance, logistics, and early-stage product environments. Proven record designing agent-facing and carrier-facing systems, contributing to architectural decisions, and partnering closely with product, design, and cross-functional engineering teams. Strong across the full stack — Rails, React, PostgreSQL/MySQL, AWS, CI/CD — with a consistent focus on performance, reliability, testing, and long-term maintainability. Actively building and shipping production-grade software end-to-end, including a multi-surface Rails + iOS + Go product currently in TestFlight, and operating self-hosted AI agent infrastructure (OpenClaw, Hermes) to compound individual engineering output.

TECHNICAL PROFICIENCIES

Ruby on Rails | Ruby 2.4–3.x | Rails 5.0–8.x | RSpec | PostgreSQL | MySQL | Redshift | DynamoDB | MongoDB | JavaScript (ES6+) | React | Node.js | Go | Swift / SwiftUI | Java (JUnit, Mockito) | Python | HTML5 | CSS3 | AWS (EC2, S3, RDS, DynamoDB, Lambda) | Docker | Terraform | Cloudflare CDN | Heroku | Render.com | Fly.io | GitHub Actions | CI/CD Pipelines | REST APIs | Webhooks | JWT Auth | Stripe | Twilio | Firebase Cloud Messaging | Agile / Scrum | Git / GitHub | Code Review | Test-Driven Development | Observability & Logging | AI-Assisted Development | Agentic Engineering Workflows

PROFESSIONAL EXPERIENCE

Mazari Realty LLC, Riverview, FL

January 2025 – Present

Systems & Operations Engineer

Supporting a growing real-estate operation with lightweight internal systems, data modeling, and reporting workflows to improve transaction visibility and decision speed.

- Built structured datasets and repeatable reporting logic for transaction lifecycle and cash-movement visibility, improving consistency and stakeholder trust.
- Implemented validation checks and standardized metric definitions, reducing reporting discrepancies across deals and time periods.
- Partnered directly with business stakeholders to translate operational questions into data and workflow requirements.

Empanana (Contract), Remote, FL

June 2024 – November 2024

Ruby on Rails Developer

Delivered a full-stack e-commerce and food-sales catalog platform with an integrated client-relationship and SMS-communications module, enabling customers to browse products, place orders, and receive targeted promotions.

- Designed and built the web platform on Rails 7.1 and Ruby 3.2, emphasizing modern, maintainable code and clean data models on PostgreSQL.
- Developed the customer relationship module allowing merchants to store client details and send targeted SMS promotions through third-party integrations.
- Authored RSpec test coverage across core domain models and controllers to ensure reliability and safe iteration.
- Collaborated directly with the founder to translate business requirements into shippable features on a short, iterative cadence.

Kin Insurance, Remote, FL

June 2022 – July 2023

Software Engineer (Ruby on Rails)

Contributed to the expansion of a direct-to-consumer home-insurance platform, delivering state-by-state rollouts and carrier-compliant features across three core Rails applications — the main insurance platform, the rating API, and the policy document generation API.

- Delivered new state functionalities on schedule, partnering with QA on rigorous bug resolution to ensure seamless integration and minimal post-deployment issues.
- Customized underwriting rules and rating logic to meet region-specific carrier and regulatory requirements, directly impacting agent-facing and policy-facing flows.

- Built an insurance moratoria system responding to government regulations that temporarily halt policy cancellations in storm-affected regions, significantly reducing manual intervention and saving hours across operations, claims, and engineering.
- Managed application deployment and infrastructure workflows using Terraform and Docker, and ensured code reliability through comprehensive RSpec coverage.
- Participated in code reviews and architectural discussions in a regulated, high-control environment where security, auditability, and data quality were critical.

Amazon Logistics (AMZL), Remote, FL

August 2019 – June 2022

Programmer / Analyst

Designed and implemented a network-level performance management platform on Ruby on Rails to enhance logistics operations, aggregating data from multiple internal sources to generate delivery scorecards and performance metrics supporting targeted improvements across the delivery network.

- Built a full-stack web application with big-data capabilities, including real-time status reporting for each delivery station and partner.
- Developed in-depth analytical views and dashboards to monitor and evaluate delivery-partner performance, significantly improving operational insight.
- Automated approximately 97% of the platform's recurring processes — data ingestion, transformation, and reporting — streamlining operations and improving reporting accuracy and cadence.
- Managed internal Amazon continuous-deployment pipelines end-to-end for Rails and Java services, driving release reliability and developer experience.
- Contributed to Java-based AMZL projects with a focus on testing and quality assurance using JUnit and Mockito; used Docker for reliable, scalable deployments.
- Partnered across operations, product, and engineering stakeholders to translate business questions into scalable Rails features and SQL-backed reporting.

Amazon, Ruskin, FL

November 2017 – August 2019

ICQA Program Developer (Full Stack Ruby on Rails)

Acted as a Full Stack Ruby on Rails developer launching a greenfield role: established the cloud development environment, set up repositories, and managed the build and deployment of internal websites supporting quality-assurance curricula.

- Led the creation of a multi-function dashboard and data aggregator, contributing over 60% of the codebase and anchoring its architecture decisions.
- Designed and implemented a Learning Management System tracking user curriculum completion over multi-week periods, with native functionality for capturing shift notes and user data.
- Built interactive single-page React.js quizzes with automatic result displays and retake options, plus peer-evaluation forms and a master reporting view for customizable curriculum and quiz analytics.
- Integrated data from APIs, Redshift, MySQL, and DynamoDB with local caching on PostgreSQL and scheduled cron jobs, improving data management and accessibility.
- Established CI/CD and deployment patterns for internal Rails applications, raising developer experience and release safety.

JPMorgan Chase, Tampa, FL

2013 – 2014

Client Service Delivery Representative

- Conducted analysis and research on cash-management inquiries across the full spectrum of custody products (FX, Asset Services, Settlements, Collateral, Securities Lending), servicing clients across the U.S., Europe, and Latin America.
- Spearheaded departmental projects aimed at enhancing operational efficiency and reducing manual processing, contributing to streamlined workflows and improved service delivery.

Citibank, Tampa, FL

2009 – 2016

Asset Services Investigations Analyst

- Served as primary liaison between Operations and institutional clients across U.S., Europe, Asia, and Latin America, managing inquiries for income and corporate-action events across direct-custody accounts.
- Recognized as Subject Matter Expert (SME) for standardizing processes and leveraging SWIFT expertise to resolve at-risk accounts and complex exceptions.
- Partnered with IT and Product to identify and resolve operational issues, leading to effective, durable solutions.

PERSONAL PROJECTS & AI AGENTIC ENGINEERING

QR Doorbell (knoc.app) — Full-Stack Product in Active Development

2026 – Present

Solo Founder / Engineer

A Ring-style doorbell experience where the owner's phone is the hardware instead of a dedicated device — a QR door-knocking app that turns any printed QR code into an async "leave a message" entry point. Spans a Rails API, a native iOS owner app, a mobile visitor web interface, and a Go service scaffold for future real-time features.

- Rails 7.x API with PostgreSQL, Solid Queue background jobs, JWT auth, Stripe billing (checkout, customer portal, webhooks), Twilio SMS, S3-compatible media storage, Firebase Cloud Messaging for push, and Rails I18n (English + Spanish).
- Native iOS app (Swift / SwiftUI, 23 Swift files) promoted to TestFlight with a working push-notification pipeline: APNs → Firebase → FCM token registration, deep-link handling from push tap to submission detail, JWT refresh on 401, and Keychain-backed secure token storage.
- Visitor mobile web hardened for real-device behavior on iOS Safari and Android Chrome: camera/audio capture, HEIC→JPEG conversion, offline/slow-connection resilience with AbortController, exponential-backoff polling, Page Visibility API pausing, WCAG AA accessibility, and i18n-driven strings.
- Go service scaffolded (Go 1.22) for Phase 2 WebRTC / real-time features, with Rails remaining source of truth for accounts, doors, and billing.
- Architected domain model (Account → Location → Door → QR Credential → Submission/Reply), active-door plan limits, rotatable internal tokens for compromised-QR recovery, jurisdiction-aware data retention, and rate limiting.

Self-Hosted AI Agent Infrastructure (OpenClaw, Hermes)

2025 – Present

Personal Engineering Practice

- Operates a self-hosted OpenClaw agent stack with persistent layered memory, cron scheduling, skills, and messaging integrations (Telegram, Gmail, email) running continuously on personal infrastructure.
- Runs a Hermes AI agent environment alongside OpenClaw and orchestrates coding agents (Claude Code, subagents) as part of day-to-day development workflow.
- Uses agent-assisted engineering pragmatically — architecture review, refactoring, testing, release tooling, and background automations — while maintaining full human ownership of design decisions, code review, and production changes.
- Comfort with modern AI-augmented developer workflows is a significant force multiplier on individual output and team velocity.

SELECTED IMPACT HIGHLIGHTS

- Shipped state-rollout and regulatory-response features across three core Rails applications at a home-insurance carrier, directly supporting agent and policy workflows.
- Automated ~97% of a logistics analytics platform's recurring processes, significantly reducing manual work and improving operational cadence at Amazon scale.
- Anchored a greenfield full-stack Rails + React platform at Amazon ICQA, contributing 60%+ of the codebase and establishing its CI/CD foundation.
- Currently shipping a full-stack Rails + iOS + Go product end-to-end as sole engineer, including a TestFlight iOS build with a working push-notification pipeline.

EDUCATION

Eckerd College — B.A. Economics, Minor in Finance — Saint Petersburg, FL

The Iron Yard — Backend Engineering Certificate

ADDITIONAL PROFILE SIGNALS

- Bilingual: English and Spanish
- Comfortable spanning backend, frontend, mobile, and infrastructure — end-to-end ownership
- Strong communicator between engineering, product, and business stakeholders
- Fluent in modern AI-assisted development workflows
